

## PowerShell Scripting

Using Windows PowerShell, rewrite your Linux Shell script called *greetme* that will:

- a. Ask the user to enter full name
- b. Display a greeting message, "Hello <user full name>. How are you? Welcome to Windows PowerShell Scripting".
- c. Print the system date and the time
- d. Print the system disks information
- e. Print the name of your Windows machine
- f. Print the name and release of this operating system
- g. Display all processes currently running on the operating system
- h. Display the Windows IP address
- i. Tell the user "Good bye <user full name>. See you next time!"

When you are done compiling, debugging, running, and testing your program, please submit your error free PowerShell script program source code to our class blackboard. You can cut & paste your program and put the code into a file together with the program output. Please make sure you have a comment section in your program, your name, the name of this script, and the purpose of the script.
